Transform Print Streams with Barr EOM

Transform Print Streams with Barr EOM

Barr EOM helps you maximize productivity of any print environment that includes a variety of platforms and print devices. Whether you want to send legacy output to printing systems on your network, or network print streams to legacy production printers, you'll need a transformation package capable of converting from one print language to the next.

Barr EOM benefits customers who want to get the most use out of every piece of printing equipment they own, as well as customers who wish to install new printing equipment without making changes to their existing applications. Barr EOM brings together, in one place, all the conversion options your company needs to make every printer available to every application. And because it gives you the ability to view the final output before you send it to your printers, you know your jobs are going to print in their proper format the first time.

Key Features

**Support any print stream** – Transform the document from any Page Description Language (PDL) to another PDL.

Barr EOM allows you to convert documents seamlessly to many of the most popular data formats

## BARR SYSTEMS
I/Omation

Burst your documents – Divide large documents or print jobs into smaller documents based on information found in the data such as account numbers or department codes.

Instead of the manual practice of reading a long printed report; locating the separator; and building separate stacks of paper; Barr EOM does this processing before the report is ever printed. For example, if the original document included invoices for 1,000 clients, the result of this bursting action would be 1,000 small documents, each named according to the respective account number, ready to distribute to each client through a combination of print and electronic delivery!

If you receive and print mainframe jobs, you know that many of them contain multiple reports per job. In these cases, Barr EOM separates them into individual reports every time a new report number or name is encountered either in the data header or on the report itself.

Bundle your documents – Merge multiple documents into one larger print job.

Bundle jobs based on any number of criteria from account number, name, department, district, type of report, etc.

Bundling adds value when you need to send a set of different reports or documents to a single destination, based upon matching criteria. As the various software applications generate these reports, Barr EOM captures the files and combines them into one document. The original file type/format of these documents does not matter. For example, if you need to bundle AFP and PCL jobs together, Barr EOM can do that and produce any type of file you may require. Barr EOM can bundle AFP and PCL jobs together and generate AFP, PCL and PDF copies of the newly bundled document as desired by different recipients.

Reformat and repurpose your print streams – Print files are often generated on document composition tools residing on mainframes or workstations. These files are created for one primary purpose, such as printing on a high-speed printer. Often users need to repurpose the data contained in these print files to enable additional applications beyond printing. You might also have a need to make modifications to the content stream without touching the originating composition platform. Barr EOM can —

- Filter-out of documents or individual pages according to predefined criteria (e.g. payment slips)
- Add text, OMR marks, barcodes, overlays, and images
- Change the page size and repositioning page content
- Delete text or areas
- Automatically classify and index
- Additional options for processing page layout such as the automatic rotating of misaligned pages
